

Remote possibilities

Not many businesses can boast hardware that's fit for the US military – and with the RGS-Xtreme server, Computrad is ready to take the egaming world by storm

COMPUTRAD EUROPE IS THE oldest new kid on the block. We have been delivering remote gaming infrastructure solutions to the egaming sector for more than five years and have worked extensively with some of the largest global egaming operators in Europe and Asia Pacific.

Computrad Europe is now firmly positioned as the leading and only dedicated global IT infrastructure expert for egaming. We specialise in only two verticals – the US military and egaming – and our experience and ability to deliver quality solutions has been developed through our long-standing work with the military's IT infrastructure.

We are proud to say that we are so good at what we do that we are the only IT GSA schedule holder for Europe and the Middle East (meaning Computrad is the only IT provider cleared and trusted by the US Department of Defense to sell and develop IT infrastructure solutions for the US army, navy and air force in the whole of Europe, the Middle East and Africa).

.....
How Computrad can help egaming

RGS-Xtreme – the all-in-one solution

What does this mean for egaming, you might ask? Through our extensive research and development processes for US defence, we have developed solutions that fit specifically into the egaming arena, such as the RGS-Xtreme server for new operators.

The RGS-Xtreme enables businesses to enter the highly competitive gaming market with scalable but egaming-specific hardware – as an operator grows the RGS-Xtreme can scale as well as offer

competitive advantages, in terms of speed and the user-experience of egaming software.

Computrad identified the need for standardisation, simplification and reliability in egaming system integration – and so designed the RGS-Xtreme to fit into any remote gaming operator's environment from start-up to enterprise.

The RGS-Xtreme is built on an HP DL platform that has passed extensive military-grade testing. Designed in partnership with many vendors – including Microsoft, Citrix, Virtual Firewall and Vasco (incorporating its strong token authentication) – this complete solution unit is brought together in one easy-to-manage interface designed by Computrad. The RGS-Xtreme 3000 model supports up to 50 virtual servers, up to 30 web servers, up to eight database servers and up to 6TBs of storage. The RGS-Xtreme also includes 38 ethernet ports capable of 10/100/1000-port speeds.

Mobile phone gaming

Computrad, in partnership with a leading manufacturer, has developed solutions that will slot into any standard egaming server, and will result in offering optimised and accelerated connections to mobile phones without the client needing to install any software on their handsets. This advancement will represent a whole new era in the egaming world, as well as open the door for egaming operators to provide clients with 'on-the-go' content-rich, interactive gaming ability.

Comprehensive service

We also use our military IT design experience to mitigate denial-of-service attacks, implement global server-load balancing, develop high-performance databases, ecommerce systems, fault-resilient clusters, storage area networks, and compliance solutions for SoX, PCI, HIPAA, and other compliance mandates.

Computrad's purpose is to support the client at every step – from design, build, certification and implementation – while supporting and managing the complete environment, if required.
